

Class Modelling Concepts:

The purpose of class modeling is to describe objects in the system. It has the following concepts:

1. **Objects**
2. **Classes**
3. **Attributes**
4. **Operations**
5. **Link and Associations**
6. **Generalization and inheritance**
7. **Grouping constructs**

Class Modelling:

- Object modelling
- Static analysis diagram
- Objects and their relationships
- Describes the attributes and operations of the objects
- Class and object diagram

Objects:

- An object represents an **entity , concept , abstraction or thing** and meaning of the problem at hand
- Objects can be: Concrete, or Conceptual
- Objects serve two purposes:
 - Understanding of the real world

- Provides a practical basis for computer implementation
- The purpose of the object modeling is to describe objects
- All objects have identity and are distinguishable
- Object in a class share a common attributes and behaviour

Classes:

- A class is a definition of an object
- A class is a set of objects that share a common structure and a common behavior
- A class is a template for producing objects of a certain type
- Class Name - Singular nouns

Class Notation:

- OMT symbol is rectangle box
- A class is drawn as a rectangle with three compartments separated by horizontal lines
- Access modifiers
 - ✓ + public
 - ✓ - private
 - ✓ # protected

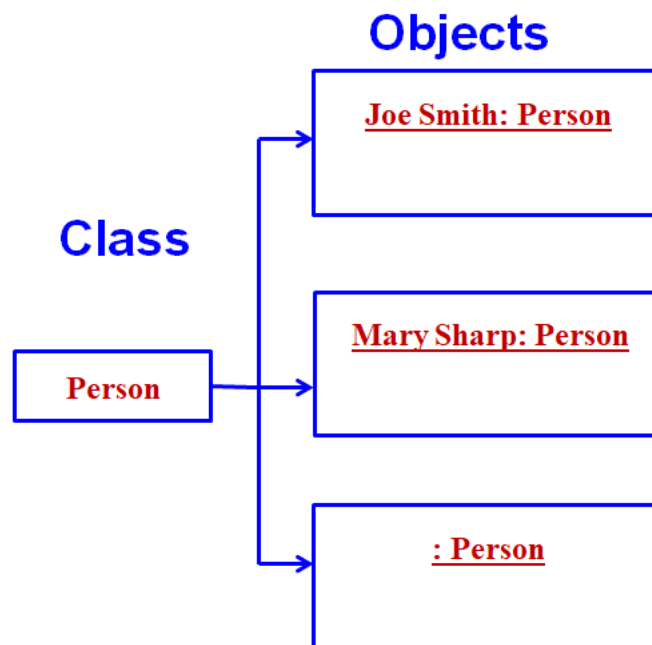

Object Instance Notation:

- It describes object instances
- OMT symbol is also a box but with an object name followed by a colon and the class name

Object name: Class name

Class and Objects

Attributes:

- A data value held by the objects in a class
- Attribute name is unique within class
- It should be a pure data value
- Attributes are listed in the second part of the box

- Attribute name may be followed by optional details, such as type and default value

Attributes and values:

Person
+ Gender:String - Age:integer

Class with Attributes

<u>Joe Smith: Person</u>
Gender="Male" Age=24

Objects with Values

<u>Mary Sharp: Person</u>
Gender="Female" Age=52

Operations and Methods:

Person
Name:String Gender:String Age:integer
+ getAge():integer # Update(name)

- An operation is a function or transformation that may be applied to object in a class
- All objects in a class share the same operations
- A method is the implementation of an operation for a class
- Each operation name may be followed by optional details, such as argument list and result type

Class Example

Student
+ <u>name:String</u> + <u>regno:integer</u> - <u>result:String</u>
+ <u>getResult():String</u> # <u>Update(name)</u>

Book
+ <u>title:String</u> + <u>authors:String</u> + <u>year:integer</u>
+ <u>getTitle():String</u> # <u>addauthor(name)</u>

TextFile
<u>name:String</u> <u>size:integer</u>
+ <u>getSize():integer</u> # <u>open(name)</u>

Rectangle
<u>height:double</u> <u>width:doubl</u>
+ <u>draw():void</u> + <u>erase()</u> + <u>zoom(double)</u>

Customer
<u>name:String</u> <u>address:String</u> <u>phone:integer</u>
+ <u>add()</u> + <u>update()</u> + <u>delete()</u>

Order
<u>number:String</u> <u>date:Date</u>
+ <u>confirm()</u> + <u>cancel()</u> + <u>reorder()</u>
